RONGELAP DATA

SYMBOL: BMREW: GMD

On February 3, 1959 a meeting was held to discuss:

- a. the current data on the Rongelapese and their food supply, and
- b. the program for collecting and analysis of future samples.

We were handicapped by the absence of a representative from the University of Washington, but there were discussions of the currently known information. Dr. Conard left a copy of the draft of his report on the 1958 survey.

It was agreed that during the Spring 1959 survey -

- a. from 8 to 10 representative meals would be collected as well as additional samples of pandanus,
- b. further information would be sought on actual eating habits of the Rongelapese,
- c. careful records would be kept concerning the manner of collecting and handling the samples, and
- d. Dr. Conard would continue his studies along the lines of his efforts in 1958. In the absence of a representative from the University of Washington it was not possible to discuss their proposed resurvey.

There was a brief discussion on the desirability of establishing a central file into which data would be transmitted and from which information might be sought by those concerned with environmental contamination in the Pacific.
