

DONNER LABORATORY
BERKELEY 4, CALIFORNIA

June 6 1963

Dear Dr. Meyer,

Here are the data on the Marshallese people. Some of the data looks very peculiar. There is enough serum left over to redistill most of the patient samples. If you think any people should be redone, I will redistill serum and make a new body water determination.

Did you get my May 2 letter with the information on the references that you requested?

I do hope the delay in sending you these data has not set the rest of your work back too far. We were without access to a reliable scintillation counter from before Christmas 1962 till three weeks ago. It took several weeks to calibrate and test our new machine and to have the inevitable little "bugs" repaired.

From looking at the enclosed figures we have all got the impression that the Marshallese people must look very different from Americans. We look forward to seeing some more data from them.

Sincerely

Rosemary A. Hughes
