Dr. C. L. Dunham  
Division of Biology and Medicine  
U.S.A.E.C.  
Washington 25, D.C.

Daily filter samples of outdoor air dusts collected during the period February 25th, 26th, and 27th and stored 48 hours or more exhibit beta gamma activity 9 to 13 times background, further estimated at 19 to 27 micro micro curies per cubic meter air, peaking at February 26th. Similar data obtained at our Livermore site.
