Title: Absorption Studies

Purpose: Investigation of data accumulated during operation Plumbbob - to check on usefulness of data in the identification of Beta emitters. Also to correlate Absorption with decay studies in attempt to explain observed differences in type of detonation.

Procedure: Semi-log plots are to be made of activity in cpm vs mg/cm² of Aluminum absorber thickness. ~~In [illegible]~~ extrapolated tail of the decay plot would give the non-Beta energies. A graphic subtraction of the non-Beta emitters from the gross cpm would give the Beta curve. The observed change in slopes in the Beta curve would indicate a thickness of absorber where certain Beta emitters are blocked out. A calculation would then be check for the expected mass that such a thickness of Aluminum would stop. By the determination of the mass ~~that would be [illegible] of the~~ a possible single Beta emitter should could be chosen which was characteristic by the mass determined.

Two locations, WT and KM, were chosen on
from results of ~~[illegible]~~. Shot 8.

c. Preliminary Observations

It has been found from the ~~[illegible]~~ runs
log plotted values that the curve does not
reach a ~~[illegible]~~ true tail flattening point. ~~[illegible]~~ such
a flattening is characteristic of the values
of absorber ~~[illegible]~~ thick enough to stop all
beta particles, when the remaining activity is
due solely to Gamma energies, and possibly
X-Rays. This is in part due to a sufficient
number of absorbers ~~[illegible]~~ to define the
curve.

d. Proposal

Due to the difficulties that has arisen
from the plate it has been decided to eliminate
Gamma radiation before starting the Shot 3.
