DATA FOR ESTIMATION OF WHOLE BODY GAMMA DOSE TO EXPOSED PERSONNEL IN PACIFIC

As reported in a previous memorandum, the best estimates of gamma doses are as follows:

Rongelap natives	150 r
Rongerik natives (Transient from Rongelap)	75 r
Rongerik	15 r
Air Weather Personnel on Tinianak Island of Rongerik Atoll	40 - 50 (except 3 Army personnel with 98 r)

All available data were used in arriving at these estimates. These data are reported in an annex to this memorandum. Not included in the above estimates are the contributions of soft gammas (below 70 kev) nor betas. These undoubtedly contributed biologically significant doses.

Although uncertainties in arriving at an estimate are probably well known, they will bear repeating here to indicate the difficulty of computing the whole body gamma dose.

1. Decay exponents have been reported ranging from -0.9 to -1.5+. What is desired here is the decay exponent for the time from fallout to the time of evacuation. This is not known with certainty and therefore -1.2 has been assumed.

2.  $Np^{239}$  contamination. If a single dose rate reading is made at the peak of the relative  $Np^{239}$  activity and then an integration made according to -1.2, a serious miscalculation might be introduced. Likewise, ignoring the radiation dose from  $Np^{239}$  would not be desirable. The above whole body estimates are made taking the  $Np^{239}$  contamination into account, since the amount produced has been estimated for this device.

3. Location of personnel. Dose rate readings vary by almost a factor of two for different localities where the natives might have been. Where they were and how long they remained has not been determined with certainty. The dose rate reading in the sleeping barracks of the Air Weather personnel was only about 1/3 of that outside; the dose rate inside of the native huts was almost as high as outside. The natives slept on the ground or on mats that were almost as hot as outside the huts, and in this horizontal position energetic betas could have delivered a more effective body rep dose.

4. Sky shine. The phenomena of sky shine with the passage of the cloud was documented at St. George, Utah in the spring of 1953. The gamma dose from the sky shine might have been appreciable when one considers the relatively heavy fallout. This factor is extremely difficult to assess.

5. Dose rate readings were made by different individuals, at different times, at different locations, and by different types of instruments some of which were calibrated and some were not.

6. The exact time of initial fallout is not known. An hour or even half-hour difference in estimating initial time of fallout will make a difference in estimating doses in the early times after detection.

This material contains information affecting the national defense of the United States within the meaning of the espionage laws, Title 18, U.S.C., Secs. 793 and 794, the transmission or revelation of which in any manner to an unauthorized person is prohibited by law.

ROMEPLAP

A. Estimated time of fallout: 5-6 hours.

B. Size of evacuation and number of evacuees: H # 51 (16 by air;  
43 by ship)

C. Radiation levels.  
1. (Evacuation Team)

This material contains information affecting the national defense of the United States within the meaning of the espionage laws, Title 18, U.S.C., Secs. 793 and 794, the transmission or revelation of which in any manner to an unauthorized person is prohibited by law.

Decontamination Readings - 3 March 1954

Time (1/2)	Place	Geiger Muller Reading (R/50hrs)
0905	Hut at landing	1.0 R
0900	Hut 100 yards from landing	1. R
0903	120 yards from landing	1.5 R
0904	Hut 50 yards over # 50 yds. from landing	1.2 R
0905	Hut 25 yds. over # 50 yds. from landing	1.2 R
0906	20 yds. in 50 yds. from landing	1.4 R
0907	at landing	
0915	200 yards from beach on ground	1.3 R
"	" " " " 3' level	1.3 R
0917	250 yards from beach on ground	1.6 R
"	" " " " " traces	1.3 R
0920	150 yards from beach on ground	1.9 R
"	" " " " " 3' level	1.5 R
0922	100 yards in at school house	1.3 R
0925	50 yards from beach	1.5 R
1020	100 yards in from landing on ground	1.6 R

2. 1.4 r/hr at H # 31  
2. 7 r/hr at H # 55  
(BYOO aerial survey)

3. 1.4 r/hr at H # 36 (Lt. Larson of Task Force)

4.

Typical Readings in Nonrolap Village, 8 March

<u>Location</u>	<u>Dose Rate (nr/hr)</u>
Rongelap Island (average)	375
Center of village	280
Near central cistern	300
Near southern cistern	230
Near northern cistern	350

(Seville using 41)

5. 40 nr/hr at D / 25 (Seville using PAR-39)

~~CONFIDENTIAL~~

AMINGINASI ATOLL (SIFU ISLAND)

- A. Estimated time of fallout: 5-6 hours.
- B. Time of evacuation: H / 5 1/2 hours.
- C. Number of evacuees: 13 natives.
- D. Radiation levels:
1. 400 mr/hr at H / 31  
210 mr/hr at H / 75  
(100 aerial survey)
  2. 445 mr/hr at H / 53  
(Member of Task Force using TIB)
  3. 100 mr/hr at D / 9  
(Scoville using TIB)

- A. Estimated time of fallout: 7.5 hours.
- B. Time of evacuation and number of evacuees: 8 air weather personnel at H + 23 hours; 20 air weather personnel at H + 34 hours.
- C. Radiation levels.
  - 1. Film badge readings:
    - 93 reentgens (approximating 3 Army personnel at one end of island. Was hung about 4 feet high on the tent pole)
    - 82 reentgens (hung between and against one wall of metal barracks)
    - 44 reentgens
    - 40 reentgens
    - 40 reentgens (representing 8 people)
    - 38.5 reentgens (in an icebox)
    - 38 reentgens (" " " )
    - 37.5 reentgens (" " " )
  - 2. RICO automatic recorder went off-scale (100 mr/hr) at H + 7.3 hours.
  - 3. 1.8 r/hr at H + 23 hours (evacuation team)
  - 4. (Socoville using TIB)

EX-101 L READINGS IN CAMP GE ENIWETOK IS. - 10 MARCH

<u>Location</u>	<u>Outside Dose Rate (mr/hr)</u>	<u>Inside Dose Rate (mr/hr)</u>
Eniwetok Island (average)	230	--
Mess hall	220	110
Tent, edge of rain camp	270	175
Latrine	260	160
Sleeping quarters	260	90
Dispensary	230	110
Radio Station	250	150
Weather Station (N end of island)	250	110
Proj. 6.6 Station (S end of " )	240	--

17 March, 1200 MINE

Living Area Readings:

— Mess hall interior	40 - 100 nr/hr
Hospital interior	50 - 75 nr/hr
Hall from hospital to mess	100 - 110 nr/hr
Store room (behind mess)	50 - 55 nr/hr
Interior store room tent	100 - 150 nr/hr
General Area exterior	100 - 150 nr/hr

Weather Station Site Readings:

Exterior areas local	125 - 150 - 160 nr/hr
Interior all tents	50 - 75 nr/hr
Interior building	50 - 60 nr/hr

Army Site Readings:

General area	140 - 190 nr/hr
Interior tents	70 - 80 nr/hr
Adjacent to trailer	160 - 180 nr/hr

19 March, 1100 - 1200 MINE

Reading on beach	42 nr/hr
Living area	60 nr/hr
Inside mess hall	22 nr/hr
Inside dispensary	26 nr/hr
Inside barracks	23 nr/hr
NSE end of island (Edwinsende)	47 nr/hr
Along road to Edwinsende area 40-42	- 40 nr/hr
Inside weather building	23 nr/hr
Work area outside building	60 nr/hr
Army area (around trailer)	40 nr/hr
Inside foliage area	40 nr/hr
Inside tent	19 nr/hr

19 March, 1400 MINE

Inside weather building	21 nr/hr
Living area Still	60 nr/hr
Inside barracks	23 nr/hr
Inside dispensary	25 nr/hr
